

*Oh no! You almost forgot to season your burgers before eating them!*

*To make matters worse, you've recently adopted a needlessly complicated scientific approach to seasoning things. Before seasoning anything, you divide it into a 5-by-3 grid and rate each sector of this grid by its tastiness (assigning it a number between 0 and 4). You then meticulously season each sector of the grid with salt or pepper in accordance with the following rules:*

- Each sector must be seasoned with either salt or pepper, but not both.
- If a sector with rating  $n$  contains pepper, exactly  $n$  of its horizontally and vertically adjacent sectors must contain salt.
- If a sector with rating  $n$  contains salt, exactly  $n$  of its horizontally adjacent sectors must contain pepper.

*Season all your food quickly before it gets cold!*
